Functions

1. Zoom

- Max. zoom ratio
  - Optical Zoom: Max x10
  - Digital Zoom: Max x32
  - Optical + Digital Zoom: Max x320

※ Digital Zoom cannot be used when the motion detection is turned on.

- Digital zoom mode
  - Combined mode:
    After the optical zoom has reached its maximum level, the camera switches to digital zoom mode when zooming in. Likewise, the camera switches back to optical zoom mode after the digital zoom has reached its minimum level when zooming out.

  - Separate mode:
    Optical zoom and digital zoom can be operated separately.

2. Focus

- Auto focus mode
  - Auto Mode:
    Auto Focus automatically adjusts the focus position to maximize the high frequency content of the picture in a center measurement area, taking into consideration the high luminance and strong contrast components. Auto Mode is the normal mode for AF operation.

  - Interval Mode:
    The mode used for Auto Focus movements carried out at particular intervals. The interval time and active time for AF movements and for the timing of the stops can be set.

  - Zoom trigger mode (One push mode):
    When the zoom is changed with the TELE or the WIDE buttons, the pre-set value becomes that for AF mode. Then it stops.

- Manual focus mode
  Focus position can be adjusted by manual only using Far/Near button or Far/Near command.

  - One push trigger:
    When a Trigger Command is sent, the lens moves to adjust the focus for the subject. The focus lens then holds that position until the next Trigger Command is input.

  - Infinity mode:
    The lens is forcibly moved to a position suitable for an unlimited distance.

- Near Limit (Focus Distance)
  Can be set in minimum range of focus.

3. White balance

- AUTO mode
  This mode computes the white balance value output using color information from the entire screen. It outputs the proper value using the color temperature.

- One push mode
  This is a fixed white balance mode that may be automatically readjusted only at the request of the user (One-push Trigger)

- Manual mode
  Manual control of R and B gain.

- Indoor mode
  3700K base mode

- Outdoor mode
  5100K base mode

4. Auto Exposure

- Exposure mode
  - Auto mode:
    Full Auto with Auto Iris and Shutter Speed. User can turn on/off AGC and Digital Slow Shutter feature.

  - Iris priority mode:
    User can set Iris Level, and shutter speed is set automatically according to the brightness of the subject. User can turn on/off AGC and Digital Slow Shutter.

  - Shutter priority mode:
    User can set variable shutter speed, and Iris is set automatically according to the brightness of the subject. User can turn on/off AGC.

  - Manual mode:
    User can set Iris, Shutter speed and Gain. User can also use Digital Slow Shutter by adjusting the shutter speed.

  - Bright mode (Manual):
    User can set Iris and Gain.

  ※ Refer to the Exposure Control in Command List for the value range of AGC Gain, Shutter Speed, Iris and Exposure compensation.

- Exposure compensation (Brightness)
  - Function to offset the internal reference brightness level used in the AE mode.

5. WDR (Wide Dynamic Range)

The WDR function ensures that when images are shot with a wide dynamic range, the camera can balance the lighting to have a clear image, without loss in details in darker or lighter parts due to under- or overexposure. This is achieved by combining a multiple number of images, shot at different exposure durations.

※ WDR does not work in Manual Exposure Mode and Shutter Priority Mode.

6. BLC (Back Light Compensation)

The BLC function provides compensation by increasing the brightness of the overall screen so that subjects being shot with a loss of dark detail due to backlight will have just the right brightness level.

※ WDR and BLC cannot be used at the same time.
(When WDR On, BLC is Off. And when BLC is On, WDR is Off)
※ BLC does not work in Manual Exposure Mode.

7. Day&Night (ICR) mode

An infrared (IR) cut-filter can be disengaged from the image path for increased sensitivity in low light environment. The ICR will automatically engage depending on the ambient light, allowing the camera to be effective in day/night environments.

- Auto Mode:
  Automatically switches the settings needed for attaching or removing the IR Cut Filter. With a set level of darkness, the IR Cut Filter is automatically disabled. With a level of brightness, the IR Cut Filter is automatically enabled.
  - IR Detection:
    On systems equipped with an IR light, the internal data of the camera is used to make the proper decisions to avoid malfunctions.

- Ext-In Mode:
  Switches to Day mode when the input from D&N-IN Port is High and switches to Night mode when it is low.

8. DIS (Digital Image Stabilizer)

The DIS function internally detects shaking of the image due to camera shaking, and performs digital compensation processing to suppress this shaking and stabilize the image output.

9. Sharpness (Aperture)

This function adjusts the enhancement of the edge of objects in the picture.

10. Freeze

Captures an image in the field memory of the camera so that this image can be output continuously.

11. Privacy Mask

- Mask can be set on up to 24 places according to Pan/Tilt positions.
- Individual on/off zone masking settings.
- Two groups from among 14 colors in each group transparency can be individually set for each or 24 privacy zones.

12. Motion Detection

Instructs the camera to detect movement within the monitoring area and the send an alarm signal automatically.

- You can set up to 3 MD Window.
- When the motion is detected in the set frame, the Alarm activates through Alarm ACK and MD-Out port.
- The interval of alarm detection and dwell time can be set up to 255 seconds in units of one second.
  - Interval Time: The MD Alarm isn't activated again till the interval time passed by.
  - Dwell Time: keeps the MD Alarm Signal (MD-Out) and MD Zoom Preset Position during the set dwell time, after the alarm activated.

13. DNR (Digital Noise Reduction)

By using both of 2D DNR (space-based) and 3D DNR (time-based), the amount of low illuminance noise has been significantly reduced and the signal-to-noise ratio(S/N) as well as horizontal resolution has been improved, resulting in a clear and sharp image display even in the dark environment.

※ If the DNR Level is set too high, the camera malfunction of image ghost can be happened in dark environment.

14. Mirror

This function reverses the video output from the camera upside down or left/right reverse.

15. HLC

Select High Light Compensation. When extremely bright light is projected to the camera masking is used on the portion to prevent partial saturation on the monitor.

16. Defog

Eliminate amount of fog on display screen. When DEFOG is ON, ACE and WDR function cannot turn on.

17. Lens Initialize

Initialize the zoom and focus of the lens. Even when power is already on, it initializes the Zoom and the Focus.

18. Comp Scan

A pixel blemish-masking feature, which can be made to reevaluate overall CMOS pixel blemishes and mask severely flawed pixels automatically upon receiving the COMP SCAN command. This feature helps to make the flaws found in CMOS images, even after the camera has been powered on for some time.

※ When you use this function, the lens needs to be blocked to prevent light getting into the lens.

19. Custom Preset

As with the position preset function, the camera shooting conditions can be stored and recalled. The settings are recalled when the power is turned on.

20. Defect / Spot pixels

Spot pixels are caused by pixel sensors (on the image sensor) that have an output which does not accurately represent the incident light on the pixel area. This makes the affected pixel look different to the surrounding pixels. Regardless of the manufacturer, all CMOS image sensors have some spot pixels; they are caused by faults in the very small transistors in the pixel sensor. The smaller the transistor is, the more likely it is to have/develop an issue. Damage can be due to manufacturing issues, but often they are caused by particle radiation such as cosmic rays, etc. Usually, these spot pixels look like pixel size (therefore small) white points seen in a dark image - in a normal scene they can be very difficult to see. Sometimes the damage is minor and the pixel will 'misbehave' to different degrees depending on the temperature, shutter speed (integration time), gain and other factors. This can make the spot pixel flash, or only appear under certain conditions. Unfortunately, with current CMOS image sensor technology it is not possible to prevent these spot pixels, and, over time as the sensor ages and accumulates damage from ambient radiation, the number of spot pixels will increase. Due to this, manufacturers of standard image sensors do not warranty against spot pixel faults. Instead, they recommend that camera designers take measures to compensate for spot pixels. This involves identifying problem pixels and replacing the pixel output with a value that has been interpolated from the surrounding pixels. However, problem pixels can be difficult to identify accurately. For example, as the temperature of the sensor fluctuates, or the exposure changes, some pixels may fall in and out of line with their expected response. Also, sensors will develop new defects after the initial factory correction has taken place. Therefore, Harrier cameras are only warrantied against major sensor faults (many pixels across) on first delivery of the camera. To mitigate against this problem, Harrier cameras offer the ability to perform a re-calibration that will eliminate new spot pixels that appear in dark scenes. When using this function, the lens must be completely covered such that no light gets into the lens - this allows the identification of white spot pixels.

- Using the ADKEY feature, or the CAM_MENUKey VISCA commands, open the On Screen Menu and select Special Functions.
- Highlight the DEFECT option and 'Select' it.

The camera will analyze the dark image and identify spot pixels so that they can be compensated for when processing the final image.

Protocol

1. Timing

As Command processing can only be carried out one time in a Vertical cycle, it takes the maximum 1V cycle time for an ACK/Completion to be returned. If the Command ACK/Completion communication time can be cut shorter than the 1V cycle time, then every 1V cycle can receive a Command.
